88005B305, and 88005B306) for the Airbus A300-600
and A310 Aircraft**

NEW ITEM!

PROBLEM

Premature and unscheduled removal of the outflow valve because the motor assembly failed. The motor failure was primarily caused by damaged windings, excessive bearing wear, overheating, or a combination of these factors.

SOLUTION

Repair motor assembly with approved overhaul/repair specifications. Motor assemblies shall meet all repair, testing, and inspection criteria as outlined in NAASCO's FAA-DER approved overhaul/repair process.

SUBSTANTIAL SAVINGS

An affordable alternative to OEM New replacements, the repaired motor assembly is restored and returned to service in 'like new' condition.

COMMITMENT TO EXCELLENCE

Since 1984, we have provided cost-effective repair solutions for a variety of aircraft components. We strive to maintain the highest quality, reliability, and dependability levels to give you the "Best Value" for your maintenance dollar.
